

Referee B rebuttal-style preview: orbital-selective localization at small D

d_{z^2} stays close to one localized spin-1/2 per site

Charge fluctuation is strongly suppressed only in the d_{z^2} sector

OBC, $L_x = 6$, $L_y = 2$, $t_1 = 1$, $t_2 = 1.28623$, $j_H = 1.43113$, $U = 5.36673$, $D = 1200$. Interior columns already show nearly perfect d_{z^2} single occupancy and vanishing $\delta n_{z^2}^2$.
